VNC connection to the CUDA hosts

To run some of the graphical examples, e.g.
/mount/share/cuda-samples/5_Simulations/nbody/nbody
you need to be logged into the computers LOCALLY. Since this is
not possible at the moment, I have devised a work-around: On cuda1-
cuda5(.cip.ph.tum.de), there is now a x11vnc server running on the
PHYSICAL DISPLAY which you can connect to (VPN connection needed!) with

gvncviewer cuda1.cip.ph.tum.de (the password is "cudaseminar")

(or whatever your favourite vncviewer is called). You now see the actual
physical screen that somebody in the CIP room sees. Once you log in, the
x11vnc exits, but you are now LOGGED IN LOCALLY IN THE CIP POOL.

In another window, log into the machine via ssh,

ssh ga12xyz@cuda1.cip.ph.tum.de

and start your own x11vnc,

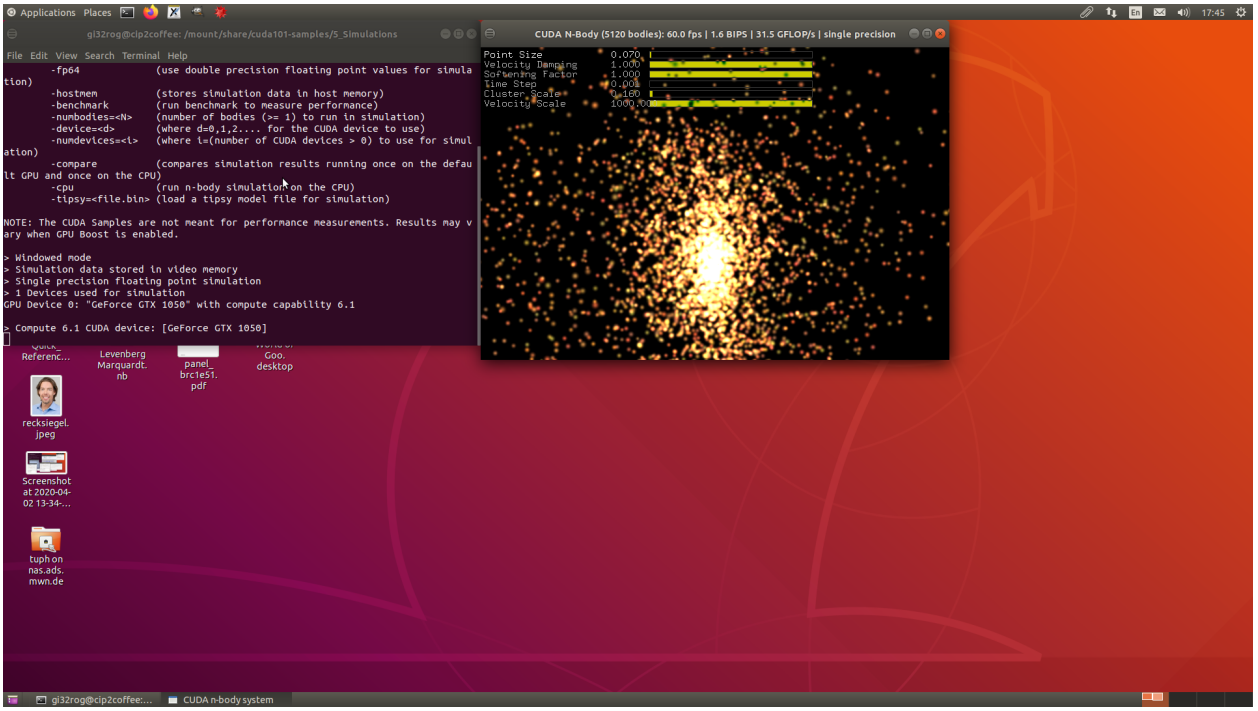
x11vnc -display :0 -passwd mypasswd

(bonus points for choosing an individual password), then connect again

gvncviewer cuda1.cip.ph.tum.de (the password is whatever you chose)

You should now see the desktop environment and be able to start any
graphical program that you want. If you have a fast connection, it might
be a good idea to limit the frame rate e.g. by adding "-wait 100" to the
x11vnc command.

Please remember that you are actually logged in locally in the CIP pool,
i.e. you need to log out at the end of your session and you should not
display private data on the screen! If your VNC connection fails, you
can always restart x11vnc and reconnect.

If you cannot connect to a machine in the first place, somebody else
is probably already logged in. Try one of the other machines, you can
check the VNC status of all CIP hosts here.


In case of problems, please contact me.
